## **NAME**

curl\_global\_cleanup - global libcurl cleanup

## **SYNOPSIS**

#include <curl/curl.h>

void curl\_global\_cleanup(void);

## **DESCRIPTION**

This function releases resources acquired by curl\_global\_init(3).

You should call *curl\_global\_cleanup(3)* once for each call you make to *curl\_global\_init(3)*, after you are done using libcurl.

**This function is not thread safe.** You must not call it when any other thread in the program (i.e. a thread sharing the same memory) is running. This doesn't just mean no other thread that is using libcurl. Because **curl\_global\_cleanup(3)** calls functions of other libraries that are similarly thread unsafe, it could conflict with any other thread that uses these other libraries.

See the description in **libcurl(3)** of global environment requirements for details of how to use this function.
